Goalrilla goal installation instructions

Never installed a basketball goal before and not sure where to start? Not a problem. Regardless of where you bought your hoop, you'll have the option to install it yourself or pay a professional to do it for you. The following article will guide you through the steps. Install them yourself The following videos will walk you step-by-step through the process of installing an in-ground basketball goal. Mix concrete for an in-ground installation The secret to a longstanding basketball hoop is in the foundation. Achieving the correct mixture of dry concrete and water can give you additional years of life! A mixture that is too thin lacks the power necessary to keep the steel pole properly in place. A mixture that is too thick will leave you struggling to fill voids that can't be seen below, compromising power again. So how do you achieve the perfect balance? Let's find out! Compressive power concrete is rated by its compressive power, meaning: how much pressure per square inch a standard cylinder of concrete can withstand before it breaks. These ratings are derived from standardized machines that can apply evenly pressure over the surface of a concrete cylinder. Compressive strength is largely determined by the composition of the mixture. Walk into any home improvement store and you'll see a variety of mixes that advertise 'fast environment,' 'high-strength,' 'crack resistant,' etc. The main difference between each of these is some mixtures may contain additional ingredients, such as fiberglass, to provide even greater band strength. If you have a specific mix you're looking for, then great, you already know what to get. However, if you're just trying to follow the instructions for your hoop, your standard 'High-Strength' mix will do just fine. What does Goalrilla recommend? Goalrilla recommends purchasing 12-13 bags of Quikrete concrete mixture. This concrete meets the ASTM C387 Standard Specifications for concrete. While directions say you only need 11 bags, it's not a bad idea to have an extra bag or two on hand in case the installation gets a little messy. As you'll find out, concrete mix can be difficult to move and it's very easy to accidentally tear open a bag. Mix the concrete as soon as you have all the appropriate material, start by opening 1-2 bags and pouring them into a large container. Add water according to what the instructions dictate. For an 80 lb. bag, you will want to use 6 pints or 2.8 L of water, or for a 60 lb. bag, you want to use 4 pints or 1.9 L per bag of concrete. If you don't measure bucket around, a 2 L soda dot bottle will work to get a close enough estimate. Create a depression in the middle of the dry mixture and add your water here. Update the mixture with a how or other tool and ensure consistency across the batch. Properly mixed concrete should be wet, but firm enough to keep its shape and in an oatmeal-like consistency. You can use his test by picking up a handful while wearing gloves. Wear. not allow the mixture to sit for long periods of time or you run the risk of letting it dry out. Move the mixture to the freshly dug hole as soon as possible and stir as you pour to help alleviate any voids. A trench shovel and extra set of hands will be useful here. On especially hot days, you may need to add more water to the mixture, as watering will evaporate. Always keep the mixture moving and ensure the mixture maintains its consistency. Repeat these steps as needed until you have the appropriate amount of concrete. Pouring concrete into cold weather installing your basketball hoop in winter is possible but has some caveats. If the outdoor temperature is below 40°F (4.44°C) for a long period of time, you will want to reconsider your installation date. Temperatures below this threshold can cause all sorts of problems your average DIY installer probably isn't equipped to handle, nor do you want to. If you choose to pour concrete during the winter months, there are few things you or your installer will want to remember. If the soil is frozen, you should wait until it thaws before you can even consider starting. You should never place concrete in frozen soil, since it has a number of problems of cracking, crossing, and establishing unequal. Use a quick setting mixture with hot water. As the name suggests, a quick setting mix will usually set under an hour. While it can set up under an hour, it will take a few more days to heal. When mixing concrete in these temperatures, regardless of type, use warm water. Use an accelerator. If you don't have access to quick-setting concrete or have already bought regular concrete, you can buy an accelerator that helps increase the concrete hydration rate. This helps to shorten the setting time and get the concrete to a higher power earlier. Avoid any accelerators or additives containing calcium chloride, as this will cause the rebar to rust and possibly cause the concrete to crack. Do not mix quick setting concrete and an accelerator. Use the healing blankets. Specifically, for cold-weather applications, concrete healing blankets help to capture in the heat and moisture, so the concrete can reach its proper strength. In addition, these blankets protect the concrete from freezing. Blankets can be purchased at your local home improvement store for about \$50-\$60 depending on your area. Keep in mind that they don't look like the blankets you would use in your home. These blankets look more tinge-like and usually come in rolls. In addition to these tips, some professional installers may have other methods or tricks they use to set concrete in colder weather. In this case, it may be better to hire a professional to do the job, since they will often have the necessary supplies, such as healing blankets, already at hand. If the cost of additional materials begins to add up, combined with the from working in the cold, you may find it's better to have someone else do it hire an installation Professional Not up to work? You can always hire a professional to install your basketball hoop for you. While you may be tempted to call a local construction company or handyman, and although some of these businesses may offer basketball goal installation, we recommend contacting a Goalrilla installation specialist. Installing a goal requires precise accuracy and specialized processes to ensure that your goal is shallow and operates at peak performance. No one knows how to do it better than a Goalrilla specialist! Look for Goalrilla Authorized Dealers Step one should always be to see if there is an authorized dealership in your area, especially a Goalrilla Platinum Dealer. Goalrillas are sold through a network of full service dealers across the country, and these Goalrilla specialists can not only help you find the best goal to buy, but they can also install them. These merchants are installing hundreds of Goalrillas every year, and know our exact specifications, so you can trust that they'll get it right! Other installers to consider for some people living in more remote areas of the country, you may not have a Goalrilla dealer nearby. In that case, you can choose to buy your Goalrilla online. Fortunately, you can still find an installer by conducting a Google search of National Installation and Meeting Service. This will give you a great place to start. If you don't have a local Goalrilla dealership or installer in your area, you might consider contacting a general contractor. A simple Google search for basketball goal installers + [YOUR CITY], needs to show up some places to get started. In this case, you might want to direct this service provider to our installation directory to make sure they have the correct information for a successful installation. How much should it cost? Managing the installation itself has its own merits, but if you pay someone to do so, you should expect professional quality. Professional installations should generally range from \$400 to \$600 from start to finish. Especially if you're working with an installation company or local contractor, be sure to get some different quotes before committing to a purchase. If you're considering a service provider that's not a Goalrilla-authorized dealer for installing your basketball goal, you might want to consider asking the following questions... Can I see your previous installations? This is by far the most important question to ask when evaluating an installer. It's a no-brainer that if someone didn't do many other installations, you probably don't want to be their first guinea pig. Most professional installers will have a gallery on their website showcasing their work. If they don't, it might be a good idea to see if they have a Facebook or other social media page where these photos are posted. What covers me Installing a complete in-ground system is a multi-step, multi-day process. The first day involves digging the hole and installing van concrete, followed by healing 3 days for the concrete, and then final meeting of the goal. Make sure the quote you receive covers the concrete installation and assembly of purpose, as well as the material to do the job. What is the timeline for the project? Most installers have several projects running simultaneously, and this is especially true during spring and summer months. You probably won't be the only project on the schedule. Before connecting to the installation, make sure to find out when they will start and when it will be completed. The installation for any Goalrilla will last at least 4 days, and a particularly busy installation schedule can delay your installation date even further. Make sure your selected installer can get your goal installed in a timeline that works for you, so you can start playing as soon as possible! Disregarding an installer's other jobs, an installation can take more than 4 days depending on the weather. The concrete takes 3 days to heal in warm temperatures, so when the mercury begins to decline, the healing process can take significantly longer. In addition, if the soil is frozen, it will be almost impossible to dig a hole. More about cold weather installations can be learned here. Be sure to discuss these conditions and other alternative options with the installer. Is there a warranty covering the installation? What is it? A botched installation can cause you and your family a lot of frustration and money. Check with the installer to see what their warranty policy is in the event of an error in installation. Be sure to make a note about the details of the warranty and get a copy if possible. If after installation something looks wrong, immediately take notes and photos to have as documentation when you call. Are you insured? Accidents happen and when there are several hundred-pound steel pole or backboard involved, the severity of a few accidents can quickly escalate. If an independent contractor (aka the installer) is finally injured while doing an installation on your property, you may be responsible. This is one of the main reasons why hiring a professional from a trusted company is a must for this type of project. A reliable company will carry insurance for these types of accidents and injuries, so you don't have to worry about a lawsuit. Always make sure you ask before agreeing to any installation and see the certificate of insurance for general liability. What are my responsibilities in the installation process? For some people, there may be additional steps you should take before an installer can start working. The big task to be completed is to have the utility lines marked. Since there is a 4-foot deep hole to be dug on the installation site, you and the installer should be aware of any buried cables. Call 811 at least few days before the digging date to have the cables marked. In addition, most installers will need to have the area cut around the installation, the free of any cars, toys, or other debris, and the box purpose easily accessible at the installation site (If you purchase your goal from a Goalrilla authorized dealer, they will likely deliver the purpose themselves for installation). Also, be sure to ask the installer if you need to be present for installation. Even if you don't have to be, it can help resolve any questions that may arise. What is the cleanup process? Once the goal is installed, there are some final cleaning notes to consider. Be sure to ask how any excess dirt will be handled or disposed of. If you want to reuse the dirt, agree on where the excess dirt will be placed. A request for the dirt placed on the side of the house or in a designated corner in the backyard should not be a problem. Also, if you purchased your Goalrilla goal online, it will be delivered on a pallet via a cargo shipment. Ask if your installer can also take care of disposing of this pallet. Well.
